Resumo

Atualizamos a lista de anfíbios do Brasil com base exclusivamente em evidências publicadas em literatura revisada por pares até Março de 2026. O trabalho incorpora novas descrições, mudanças taxonômicas, sinonímias, revalidações e registros confirmados, resultando na remoção de 41 espécies e na adição de 104 táxons. A fauna nacional passa a compreender 1251 espécies válidas, incluindo 1206 anuros, 40 cecílias e cinco salamandras. Assim, a lista fornece uma referência padronizada para estudos de sistemática, biogeografia, conservação e avaliações oficiais de risco.

Palavras-chave

ABSTRACT

We updated the list of Brazilian amphibians based exclusively on evidence published in peer-reviewed literature up to March 2026. This work incorporates new species descriptions, taxonomic changes, synonymizations, revalidations, and confirmed distribution records, resulting in the removal of 41 species and the addition of 104 taxa. The national fauna now comprises 1251 valid species, including 1206 anurans, 40 caecilians, and five salamanders. This updated list provides a standardized reference for studies in systematics, biogeography, conservation, and official risk assessments.

Keywords

Anura; Caudata; Diversity; Gymnophiona.

The most recent published list of Brazilian amphibians was compiled by Segalla et al. (2021), reporting 1188 species: 1144 anurans, 39 caecilians, and five salamanders. Accordingly, Brazil consistently holds the title of the country with the highest amphibian species richness in the world, followed by other South American countries such as Colombia (861 spp.), Ecuador (703 spp.), and Peru (682 spp.; Frost, 2025). In addition, there has been a growing trend in publications focused on amphibian diversity in Brazil and worldwide, with Brazil recognized as one of the countries with the greatest potential for the discovery of new species (Moura *&* Jetz, 2021). Several hypotheses have been proposed to explain the country's high amphibian richness, including its vast territorial extension, its location within the Neotropical region, as well as the diversity of ecoregions and complex topography (e.g. Toledo & Batista, 2012; Toledo et al., 2014; Moura et al., 2016). Since the publication of Segalla et al. (2021), several important studies have contributed to improving our knowledge of species diversity in Brazil (as detailed in subsequent sections), highlighting the need for an updated version of the national list. The species list provided here includes all currently recognized amphibian species known to occur within the political boundaries of Brazil as of 12 March 2026. For this compilation, we relied exclusively on evidence available in the peer-reviewed scientific literature. Suprageneric classification follows Frost (2025).

As detailed in the following sections, we propose the removal of 41 species and the addition of 104 species to the list, including 75 recently described species and 29 added for other taxonomic revisions or new distributional evidence. No changes were observed in the composition of salamanders, which continue to comprise five species within a single family and genus. In contrast, the number of anuran species has increased to 1206, distributed across 23 families and 111 genera, while caecilians now comprise 40 species belonging to four families and 13 genera. As a result, the known amphibian fauna of Brazil now comprises a total of 1251 species. Among these, two species, *Aquarana catesbeiana* and *Eleutherodactylus johnstonei*, are exotic, introduced, and invasive. Although a recent record reports an individual of *Kaloula pulchra* in the municipality of Campo Formoso, Bahia (Máximo et al., 2021), we did not include this species in the current list, as there is no evidence of a population establishment in Brazil.

A) Genus-level changes since the last list:

•***Allobates/Dryadobates*** – *Dryadobates* was erected by Grant et al. (2025) to accommodate Atlantic Forest species previously assigned to *Allobates*.

•***Rhaebo/Adhaerobufo*** – *Adhaerobufo* was erected by Dias et al. (2024) to accommodate *Rhaebo nasicus* and *R. ceratophrys.*

•***Caligophryne*** – Recently described genus and family (Caligophrynidae) by Fouquet et al. (2024a)

•***Noblella/Phyllonastes*** – *Phyllonastes* was resurrected by von May et al. (2024) and Ortega et al. (2025) to accommodate species of the northern *Noblella* clade, while *Noblella* sensu stricto remains restricted to the southern clade.

•***Lysapsus/Pseudis*** – *Lysapsus* was synonymized with *Pseudis* by Caballero-Gini et al. (2024).

•***Scinax/Ololygon/Julianus*** – Duellman et al. (2016) divided *Scinax* into *Scinax*, *Ololygon*, and *Julianus*. This arrangement was confirmed by Araújo-Vieira et al. (2023).

•***Megaelosia/Phantasmarana*** – *Phantasmarana* was erected by Vittorazzi et al. (2021) to resolve the paraphyly of *Megaelosia*.

•***Relictocleis/Chiasmocleis*** – *Relictocleis* was elevated to genus level by Segalla et al. (2021), but following the most recent usage (Fouquet et al., 2022a; Frost, 2025), we list the species as *Chiasmocleis*.

•***Neblinaphryne*** – Recently described genus and family (Neblinaphrynidae) by Fouquet et al. (2024a).

B) Species removed from the list published by Segalla et al. (2021):

Brachycephalidae

•***Brachycephalus atelopoide*** – Bornschein et al. (2021) discussed the diagnosis and identity of *B. atelopoide* and concluded that

the best working solution might be to follow Cochran's (1955) proposal to place *B. atelopoide* in the synonymy of *B. ephippium*. We follow Bornschein et al. (2021) to avoid inflating the Brazilian species richness.

Bufonidae

•***Melanophryniscus dorsalis*** – Now considered a junior synonym of *Melanophryniscus formosus* (Langone & Lavilla, 2024).

•***Rhaebo ecuadorensis*** – The occurrence of the species in Brazil was proposed by Mueses-Cisneros et al. (2012) based on a subadult *Rhaebo* (32.2 mm SVL) cited by Lötters et al. (2000) that lacked both a preorbital ridge and ventral white spotting. Mueses-Cisneros et al. (2012) inferred that this specimen, reportedly from the "Brazilian central Amazon" (not "central Brazil" as originally stated), "may be referred to *R. ecuadorensis*". However, given the absence of direct examination of the specimen by Mueses-Cisneros et al. (2012), its developmental stage, inconsistencies in the collection locality, and the tentative nature of this assignment, we opted to remove the species from the Brazilian species list.

•***Rhinella jimi*** – Now considered a junior synonym of *Rhinella diptycha* (Pereyra et al., 2021).

•***Rhinella scitula*** – Now considered a junior synonym of *Rhinella stanlaii* (Fouquet et al., 2024b).

Centrolenidae

•***Vitreorana uranoscopa*** – Now considered a junior synonym of *Vitreorana parvula* (Zucchetti & Castroviejo-Fisher, 2024).

Ceratophryidae

•***Lepidobatrachus asper*** – The population from the municipality of Porto Murtinho, state of Mato Grosso, which was previously identified as *L. asper* by Sugai et al. (2013), is now reassigned to *Lepidobatrachus laevis* (see Brusquetti et al., 2018).

Craugastoridae

•***Pristimantis conspicillatus*** – The species is only known with certainty from Colombia and Ecuador, with no confirmed records for Brazil (Fouquet et al., 2022b).

•***Pristimantis eurydactylus*** – The species' occurrence in Brazil remains unconfirmed, as specimens previously assigned to *P. eurydactylus* show diagnostic overlap with *P. diadematus* and lack clear morphological or genetic evidence supporting their identification (Moraes et al., 2022a).

•***Pristimantis marmoratus*** – As currently known, *P. marmoratus* is restricted to the western portion of Guiana Shield, in Venezuela and Guyana (Kok et al., 2018; Fouquet et al., 2022c). Populations treated as *P. marmoratus* in the states of Pará and Amapá were recently evaluated, leading to the revalidation of *Pristimantis grandoculis* and the description of *Pristimantis crepitaculus* (Fouquet et al., 2022c). However, the presence of the species in Brazil is likely, since the species occurs close to the national borders of the state of Roraima (Kok et al., 2018).

•***Pristimantis pluvian*** – Now considered a junior synonym of *Pristimantis fenestratus* (Fouquet et al., 2022b).

•***Pristimantis variabilis*** – Previous records of this species in Brazil were based on two sources. Firstly, Heyer (1977) reported *Pristimantis* nr. (near) *variabilis* in the state of Amazonas, specifically in the municipalities of Mucuripe and Tapauá. However, these records were not identified to the species level and lack voucher specimens. Secondly, Souza (2003), in his PhD dissertation, reported the occurrence of *P. variabilis* in the state of Acre. Nevertheless, these records were not included in a subsequent publication by the same author with the same dataset (Souza, 2009), suggesting that the earlier identification was not sustained.

•***Pristimantis academicus, Pristimantis altamazonicus, Pristimantis delius, Pristimantis diadematus, Pristimantis martiae and Pristimantis ventrimarmoratus*** – There are no confirmed records of these species in Brazil (see Mônico et al., 2024).

Dendrobatidae

•***Ranitomeya sirensis*** – Populations from the state of Acre and Amazonas previously identified as *R. sirensis* correspond to the recently described *Ranitomeya hwata* (Twomey et al., 2025).

Eleutherodactylidae

•***Adelophryne gutturosa*** – Previous records of *A. gutturosa* from the state of Amapá are in fact *A. amapaensis* (see Taucce et al., 2020).

Hylidae

•***Boana alfaroi*** – According to Fouquet et al. (2021a) the population previously identified as *B. alfaroi* by Carvalho et al. (2017) is *Boana steinbachi*.

•***Boana benitezi*** – Populations from Vila Pacaraima, state of Roraima, previously identified as *B. benitezi* by Heyer (1994) were assigned to *Boana tepuiana* by Barrio-Amorós & Brewer-Carias (2008).

•***Boana fasciata*** – Species restricted to the Andean slopes of Ecuador and Peru (Caminer & Ron, 2014; Fouquet et al., 2021a). At least part of the previous records from Acre, Amapá, Amazonas, Mato Grosso, Pará, and Rondônia correspond to one of these three species: *B. courtoisae, B. eucharis, B. steinbachi* (see Fouquet et al., 2021a).

•***Bokermannohyla napolii*** – Now considered a junior synonym of *Bokermannohyla ravida* (Faivovich et al., 2025)

•***Dendropsophus bifurcus*** – Duellman (1977) reported the species for the state of Acre, but Jungfer et al. (2010) stated that these records most likely refer to *D. salli*. More recently, *D. salli* was documented in the states of Acre and Rondônia, including photographic evidence (Melo-Sampaio & Souza, 2015). Based on these publications, there is no evidence that *D. bifurcus* occurs in Brazil.

•***Dendropsophus jimi and Dendropsophus rhea*** – Now considered a junior synonym of *Dendropsophus cerradensis* (Nakamura et al., 2025).

•***Dendropsophus koechlini*** – Now considered a junior synonym of *Dendropsophus pauiniensis* (Melo-Sampaio, 2023a).

•***Dryaderces pearsoni*** – Brazilian populations currently assigned to this species represent an undescribed taxon (see Jungfer et al., 2013; Ortiz et al., 2020).

•***Scinax baumgardneri*** – The species is known to occur in few localities in the Venezuelan Amazon (Barrio-Amorós et al., 2019) and available information suggests that *S. baumgardneri* has not been collected in the last 25 years (Araujo-Vieira et al., 2023). There is no evidence that the species occurs in Brazil, and previous Brazilian records lack voucher specimens (Crump, 1971; Azevedo-Ramos & Galatti, 2002) .

Leptodactylidae

•***Leptodactylus sertanejo*** – Now considered a junior synonym of *Leptodactylus jolyi* (Caramaschi et al., 2024).

•***Leptodactylus rugosus*** – We are unaware of any published or voucher evidence confirming the occurrence of this species in Brazil.

Microhylidae

•***Chiasmocleis jimi*** – We follow Cassundé et al. (2022) and Fouquet et al. (2022a) in maintaining the synonymy of *C. jimi* with *C. hudsoni*.

•***Chiasmocleis haddadi*** – Populations from the state of Amapá, previously identified as *C. haddadi* (e.g. Peloso et al., 2014; Taucce et al., 2022), are assigned to the recently described *Chiasmocleis jacki* (Fouquet et al., 2022a).

•***Elachistocleis bumbameuboi*** **and** ***Elachistocleis carvalhoi*** – Now considered junior synonyms of *Elachistocleis magna* (Novaes-e-Fagundes et al., 2023).

•***Elachistocleis matogrosso*** – Now considered a junior synonym of *Elachistocleis bicolor* (Novaes-e-Fagundes et al., 2023).

•***Elachistocleis surumu*** – Now considered a junior synonym of *Elachistocleis surinamensis* (Novaes-e-Fagundes et al., 2023).

•***Otophryne pyburni*** – The distribution of this species was restricted to the western portion of the Guiana Shield in a recent study (Fouquet et al., 2021b), with no known records in Brazil. Therefore, records from the states of Amazonas, Pará and Amapá (*e.g.* Carvalho et al., 2007; Cassundé et al., 2022; Taucce et al., 2022) correspond to lineages not closely related to *O. pyburni* (Fouquet et al., 2021b).

•***Synapturanus salseri*** - The species is only known with certainty from Timbó, Vaupés, Colombia, and surroundings (Fouquet et al., 2021b). At least part of the previous records in Amazonas state corresponds to the recently described *Synapturanus ajuricaba* (Fouquet et al., 2021c).

Odontophrynidae

•***Odontophrynus americanu***s – The Brazilian populations previously assigned to this species belong to the recently revalidated species *Odontophrynus asper* (Rosset et al., 2022) or *O. toledoi* (Moroti et al., 2022).

C) Species added to the Brazilian list after Segalla et al. (2021) through taxonomic changes or range extensions

Aromobatidae

•***Dryadobates alagoanus, Dryadobates capixaba, Dryadobates carioca*** - Removed from the synonymy with *Dryadobates olfersioides* (Grant et al., 2025).

Bufonidae

•***Amazophrynella siona*** – Recorded in the state of Amazonas (Moraes et al., 2022b).

•***Melanophryniscus formosus*** – Populations from the coastal Atlantic Forest of Rio Grande do Sul and southern Santa Catarina previously referred to as *M. dorsalis* correspond to *M. formosus*, which has nomenclatural priority (Langone & Lavilla, 2024).

•***Rhinella martyi*** (Fig. 1A) – Removed from synonymy with *R. margaritifera* (Fouquet et al., 2024b).

•***Rhinella roqueana*** (Fig. 1B) – Recorded in the states of Acre, Amazonas, Mato Grosso, Pará, and Rondônia (Fouquet et al., 2024b).

•***Rhinella stanlaii*** (Fig. 1C) – Revalidated as a senior synonym of *Rhinella scitula* (Fouquet et al., 2024b).

Ceratophryidae

•***Lepidobatrachus laevis*** (Fig. 1D) – Population of the municipality of Porto Murtinho, state of Mato Grosso, previously identified as *L. asper* (Sugai et al., 2013) found to be *Lepidobatrachus laevis* (Brusquetti et al., 2018).

Craugastoridae

•***Pristimantis espedeus*** – Recorded in state of Amapá (Vacher et al., 2020; Taucce et al., 2022).

•***Pristimantis grandoculis*** – Revalidated by Fouquet et al. (2022c).

•***Pristimantis koehleri*** – Recorded in the states of Rondônia, Amazonas and Pará (Fouquet et al., 2022b).

•***Pristimantis lirellus*** – *Pristimantis lirellus, Pristimantis okmoi* and several unidentified sequences were considered as possible synonyms and a single OTU by Mônico et al. (2024). Thus, this study reported populations treated as *P. lirellus/okmoi* for the state of Acre. We include these populations here as *P. lirellus*, since this species would be the senior synonym, in addition to the fact that the Acre populations are closer to the type locality of this species.

Dendrobatidae

•***Ranitomeya cyanovittata*** – Recorded in the state of Acre (Mônico et al., 2025a).

Hylidae

•***Boana steinbachi*** (Fig. 1E) – Recorded in the states of Acre, Amazonas and Pará (Fouquet et al., 2021a).

•***Bokermannohyla feioi*** (Fig. 1F) – Removed from the synonymy with *Bokermannohyla nanuzae* (Brunes et al., 2023).

•***Dendropsophus arndti*** (Fig. 1G) – Recorded in the state of Rondônia (Pirani et al., 2020).

•***Dendropsophus frosti*** (Fig. 1H) – Recorded in the state of Amazonas (Koch et al., 2023).

•***Dendropsophus goughi*** – Removed from the synonymy with *Dendropsophus microcephalus* (Orrico et al., 2025)

•***Dendropsophus reichlei*** – Recorded in the state of Rondônia (Oliveira & Souza, 2021).

(2021): (a) *Rhinella marty*, (b) *Rhinella roqueana*, (c) *Rhinella stanlaii*, (d) *Lepidobatrachus laevis*, (e) *Boana steinbachi*, (f) *Bokermannohyla feioi*, (g) *Dendropsophus arndti*, (h) *Dendropsophus frosti*, (i) *Scinax kennedyi*, (j) *Odontophrynus asper*. Photos by: AP Lima (a), DJ Santana (b, c, d, f, g, i); LO Drummond (d, j); ED Koch (h).

•***Dendropsophus shiwiarum*** – Recorded in the state of Acre (Moravec et al., 2025).

•***Osteocephalus heyeri*** – Recorded in the state of Amazonas (Melo-Sampaio et al., 2021).

•***Osteocephalus yasuni*** – Recorded in the state of Acre (Jungfer et al., 2013).

•***Scinax chiquitanus*** – Recorded in the state of Rondônia (Ferrão et al., 2016; Araujo-Vieira et al., 2023).

•***Scinax coerulea*** – Removed from the synonymy with *Scinax x-signatus* (Suárez-Mayorga, 2022).

•***Scinax jolyi*** – Recorded in the states of Amapá and Amazonas (Taucce et al., 2022; Araujo-Vieira et al., 2023).

•***Scinax kennedyi*** (Fig. 1I) – Recorded in the state of Roraima (Lopes & Giaretta, 2022).

Leptodactylidae

•***Leptodactylus gualambensis***– Removed from the synonymy with *Leptodactylus fuscus* (Brusquetti et al., 2025)

Odontophrynidae

•***Odontophrynus asper*** (Fig. 1J) – Revalidated species by Rosset et al. (2022).

D) The updated list of amphibians of Brazil

In this section we present the final compilation of amphibian species with confirmed records in Brazil, including invasive species and those that are extinct or presumably extinct. Numbers in parentheses indicate the number of genera or species within each respective taxon. New entries relative to Segalla et al. (2021) are highlighted in red, and the corresponding bibliographic references are listed in the References section.

Drummond L.O. Is currently a postdoctoral researcher and affiliated lecturer in the Postgraduate Program in Ecology and Natural Resources at the Universidade Estadual do Norte Fluminense Darcy Ribeiro (PPGERN/UENF). He holds a teaching degree and a Bachelor's degree in Biological Sciences (UFOP), a Master's degree in Ecology of Tropical Biomes (UFOP), and a Ph.D. in Ecology from the Federal University of Rio de Janeiro (UFRJ). His research focuses on the diversity, ecology, conservation, and taxonomy of terrestrial vertebrates, with an emphasis on herpetofauna.

Santana D.J. Is the Curator of Amphibians and a Conservation Ecologist at the Field Museum of Natural History (FMNH) in Chicago, with a joint appointment between the Negaunee Integrative Research Center and the Keller Science Action Center. He also serves as a professor in the Zoology Laboratory at the Federal University of Mato Grosso do Sul (UFMS). His academic background includes a Bachelor's degree in Biology (FAFISM), a Master's degree in Animal Biology (UFV), and a Ph.D. in Biological Sciences – Zoology (UFPB), followed by a postdoctoral fellowship at the Amphibians and Reptiles Laboratory at UFRN. He works in Zoology with an emphasis on herpetology, focusing primarily on the natural history, systematics, phylogeny, and biogeography of Neotropical amphibians.

Toledo L.F. Is a Full Professor of Vertebrate Zoology at Unicamp and curator of vertebrates and of the audiovisual archive at the Museu de Diversidade Biológica (MDBio). He specializes in herpetology, with emphasis on amphibian conservation, diversity, taxonomy, ecology, behavior, and natural history. Over his career, he has published nearly 300 scientific articles, three books, and is the founder of the journal Check List.

Lima A.P. Is a senior researcher at the National Institute of Amazonian Research (INPA) and a permanent professor in the Graduate Programs in Ecology at INPA and Zoology at the Federal University of Amazonas (UFAM). She has experience in Ecology with an emphasis on community ecology, behavior, and integrative taxonomy. In the last 15 years, she has focused on studies of biogeography and species description of Amazonian anurans, having described 30 new species, redescribed five, and documented the tadpoles of seven species.
