The genus *Leptotyphlops* Fitzinger, 1843 comprises 105 species of small and slender fossorial snakes (see McDiarmid et al. 1999; Dixon and Vaughan 2003; Passos et al. 2006; Broadley and Walach 2007; Hedges 2008) that occur in all continents with exception of Antarctica and Australia (McDiarmid et al. 1999). In South America, *Leptotyphlops* has a wide distribution range, from Venezuela to northern Argentina (McDiarmid et al. 1999). Fourteen species are found in Brazil (Bérnils 2009), but due to their secretive habits, are poorly represented in herpetological collections (Passos et al. 2005).

Amaral (1954) described *Leptotyphlops salgueiroi* (Figure 1) on the basis of a single specimen from Itá (currently Baixo Guandu), state of Espírito Santo, Brazil. Rodrigues (1997) briefly described a second individual of the species from São José do Macuco (currently São José da Vitória), state of Bahia, Brazil. Passos et al. (2005) redescribed the holotype, reported new specimens and localities, and described the hemipenis of *L. salgueiroi*. Bilate and Ribeiro (2005) reported the southernmost record of the species in the state of Rio de Janeiro.

Figure 1. *Leptotyphlops salgueiroi* (MZUFV 1397), municipality Muriaé, state of Minas Gerais, Brazil. Photo by H. C. Costa.

Herein, we report 21 new specimens of *Leptotyphlops salgueiroi* housed in the following Brazilian collections: *Museu de Zoologia João Moojen* (MZUFV), *Universidade Federal de Viçosa*, in Viçosa, Minas Gerais; *Museu Nacional* (MNRJ), *Universidade Federal do Rio de Janeiro*, in Rio de Janeiro, Rio de Janeiro; *Museu de Zoologia da Universidade de São Paulo* (MZUSP), in São Paulo, São Paulo; *Museu de Ciências Naturais* (MCN-R), *PUC-Minas*, in Belo Horizonte, Minas Gerais.

Based on this additional sample we provide new distribution map (Figure 2), morphometric and pholidosis data (Table 1) for the species. Terminology for cephalic shields, and measurements follow Passos et al. (2006). Sex was determined through a ventral incision on the base of the tail. Analysis of variance (ANOVA) using scales counts (middorsal scales and subcaudal scales) was employed in order to verify existence of sexual dimorphism. Assumptions of

univariate normality and homoscedasticity were evaluated using Kolmogorov-Smirnov and Levene tests, respectively (Zar 1999). The statistic analyses were performed using STATISTICA 6.0 for Windows.

According to Passos et al. (2005; 2006), males and females of *L. salgueiroi* have, respectively, 217-226 and 230-232 middorsals, 17-23 and 18-20 subcaudals. Data from additional specimens extend the number of middorsal and subcaudal scales to 200-226 / 17-24 in males, and 217-233 / 16-20 in females. Although the number of middorsal and subcaudal scales overlap between sexes, females showed significantly higher numbers of middorsals than males ($F_{(1,20)} = 27.9$; $p < 0.01$) and males had more subcaudals than females ($F_{(1,20)} = 25.1$; $p < 0.01$), two widespread conditions in snakes (Greene 1997). Regarding the geographic distribution of *L. salgueiroi*, our data show that this taxon has a more continental distribution than previously known (Figure 2).

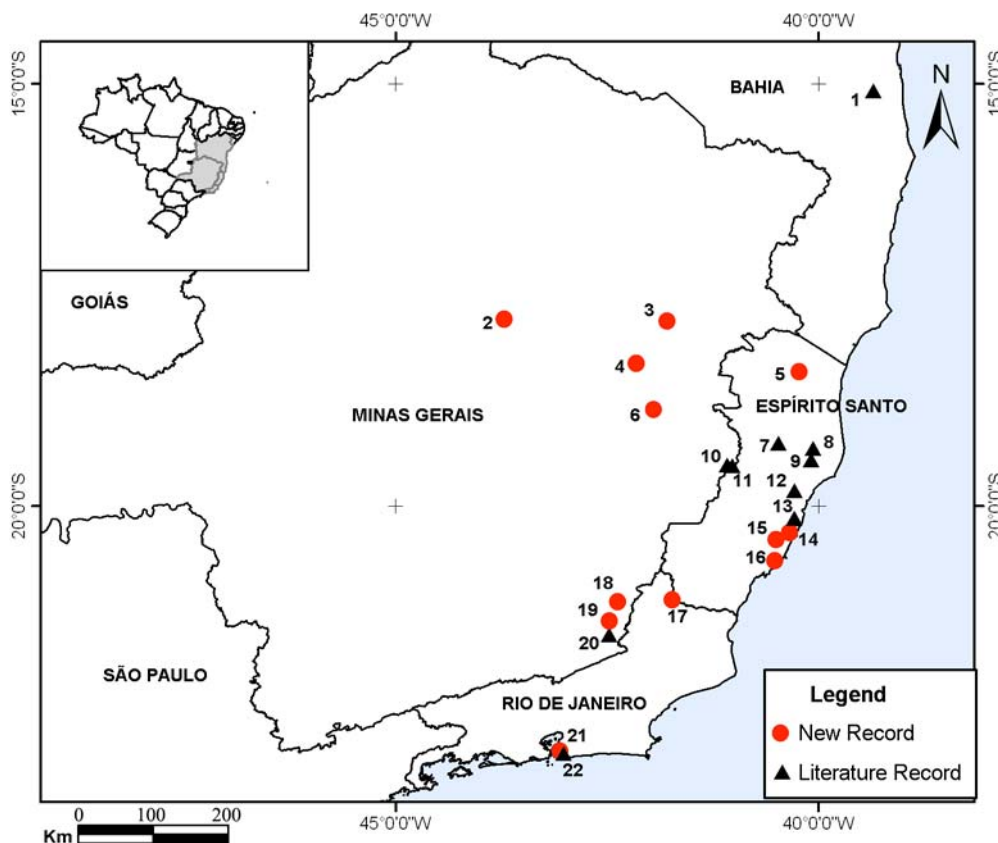

Figure 2. Geographic distribution of *Leptotyphlops salgueiroi*: 1, São José da Vitória, Bahia; 2, *Parque Nacional das Sempre Vivas*, Minas Gerais; 3, Poté, Minas Gerais; 4, São José da Safira, Minas Gerais; 5, Pinheiros, Espírito Santo; 6, Governador Valadares, Minas Gerais; 7, Governador Lidemberg, Espírito Santo; 8, Sooretama, Linhares, Espírito Santo; 9, Goytacazes, Linhares, Espírito Santo; 10, Aimorés, Minas Gerais; 11, Baixo Guandú, Espírito Santo; 12, Aracruz, Espírito Santo; 13, Campinho, Espírito Santo; 14, *Parque Estadual da Fonte Grande*, Vitória, Espírito Santo; 15, *Fazenda Campo Verde*, Viana, Espírito Santo; 16, *Vale Encantado*, Guarapari, Espírito Santo; 17, Bom Jesus de Itabapoana, Rio de Janeiro; 18, Muriaé, Minas Gerais; 19, Laranjal, Minas Gerais; 20, Recreio, Minas Gerais; 21, Cambuci, Niterói, Rio de Janeiro; 22, Itaipu, Niterói, Rio de Janeiro.

Table 1. Meristic and morphometric variation (in millimeters) of *Leptotyphlops salgueiroi*. SVL = snout-vent length, TL = tail length, MD = midbody diameter, MT = midtail diameter.

Specimens	Sex	Middorsals	Subcaudals	SVL	TAL	MB	MT

Acknowledgments: We are grateful to H. Zaher and C. Castro-Mello (MZUSP), R. Fernandes (MNRJ), L. B. Nascimento (MCN-R) and R. N. Feio (MZUFV) for allowing us to examine preserved specimens under their care; P. Passos (MNRJ) and D. Fernandes (UFRJ) for helpful insights on early versions of the manuscript; M. R. Moura for kindly drawing the map.
